

Simulation Development Portfolio

In-house development capability
and local delivery for RMN

Immersive training

Editable 3D and geographic content

Simulation Engine development tools

Simulation development portfolio

In-house development capability

VR Universal develops simulation software, editable 3D content, immersive training applications and physical control interfaces. Our company portfolio covers emergency response, command exercises, driving, drone training and naval simulation development.

Application to RMN

Our RMN approach brings together ship development, geographic area authoring, simulation content databases and development tools. Editable assets, structured records and configurable scenarios connect content creation with ongoing maintenance and local technical support.

Simulation development spanning immersive training, instructor workspaces and physical interaction.

Fire safety and command training

Coordinated training experience

Our Zhushan Training Center experience in Taiwan combines tabletop, VR and AR training with spatial workflows and software/hardware integration. The programme supports coordinated exercises for up to 20 participants.

Scenario and command development

Incident configuration, unit deployment and command workflows inform our instructor-led training approach. Editable scenarios and coordinated trainee roles provide a foundation for adapting simulation applications to maritime requirements.

Fire response and command training: incident configuration, coordinated roles and instructor-led exercises.

VR and physical interaction

Digital and physical interaction

Our portfolio includes vehicle driving with motion-based hardware, drone training with dedicated controllers and weather-recognition exercises. Training props and control interfaces connect the virtual environment with practical interaction.

Integration discipline

Our integration approach connects control mapping, user feedback and coordinated simulation states. It brings physical controls, tracking inputs and application behaviour together around the training task and operator workflow.

VR driving and physical interaction: motion hardware, control mapping and connected training displays.

Ship model development

Editable vessel development

Our vessel development study includes named components, editable Blender geometry and materials, and GLB export. The workflow connects visual modelling with asset references and vessel properties, organising content for simulator integration and subsequent modification.

Detail matched to requirements

Low, medium and high detail treatments show how vessel appearance can be scaled for the intended display and training task. Geometry, surface materials, viewing distance and runtime budgets guide asset preparation, allowing visual content to be tailored to project requirements.

Vessel content authoring with low, medium and high visual detail. Editable project: DEV_SHIP_001.

Captured content and optimisation

SIMULATION ENGINE / CAPTURED CONTENT DEVELOPMENT

Scan inspection and optimisation

From reconstructed geometry to an editable simulation asset

01 SOURCE RECONSTRUCTION

504,280 vertices / 935,255 faces

Public reconstructed scan mesh

02 POINT INSPECTION

Sampled source vertices

Derived inspection view

03 OPTIMISED MESH

139,968 faces / 85% reduction

Editable derivative and GLB export

Consistent camera angle across all stages. Point inspection is derived from mesh vertices.

Public source: Redwood Object Scans — Choi, Zhou, Miller and Koltun (2016), model 00021.

In-house processing demonstration

We processed a public reconstructed scan using Blender and Python, inspecting the mesh, deriving a vertex-point preview, simplifying geometry and exporting GLB. Face count falls from 935,255 to 139,968, approximately 85%, while the object remains recognisable.

Preparation for interactive content

Consistent camera views compare source reconstruction, vertex-point inspection and the optimised derivative. Our workflow prepares captured geometry for editing and interactive integration through mesh inspection, geometry reduction and asset export.

Scan inspection, mesh optimisation and GLB export. Source: Redwood Object Scans, Choi, Zhou, Miller and Koltun (2016), model 00021.

Ship Property Editor

Vessel configuration

Our vessel editor workspace brings together asset selection, a 3D preview and configurable name, speed, rotation, identity and category. Vessel-specific fields include firepower, value, threat and detection range.

Content authoring workflow

Search, Save, Save As and Clear Object controls organise the authoring workflow. A selected-object outline and viewing controls provide a clear design for inspecting vessel content and configuring the training library.

Other-Object Property Editor

Category-specific configuration

Our object editor design separates the asset library, geometry preview and parameter panel. The training-object example includes identity, rotation, speed, firepower, weapon cost, range and initial/terminal speed fields.

Reusable authoring structure

Search, selection and save controls are arranged within one editing workflow. Category-specific parameter panels organise the properties relevant to each object type, keeping reusable assets and training configuration together.

Other-Object Property Editor: asset selection and category-specific parameter configuration.

GIS and Training Environment Editor

Geographic exercise configuration

Our environment editor design combines regional area selection and a map workspace with longitude, latitude, date, time, weather and ocean-current settings. Layer controls and current arrows clarify the configured training environment.

Connected scenario tools

Environment, Battlefield Editor and Intel Content tabs connect geographic configuration with object placement and scenario information. Save, Save As and Clear organise the authoring workflow, bringing area settings and exercise content into one workspace.

GIS data and 3D scene development

01 Select the geographic area

Integrate geographic data / Convert coordinates / Generate geometry / Align terrain / Edit the scene

Data integration and scene generation

Our GIS product combines public terrain and mapping data in Unity with a Cesium geographic foundation. Our development generates building geometry from 2D footprints and height attributes, converts TWD97 through WGS84 and ECEF to Unity coordinates, and applies height correction to align scene content with terrain.

02 Generate the 3D environment

Editing and training application

Our product supports placement, translation and rotation, time and weather settings, and scenario/task authoring. Terrain, geographic layers and placed objects form reusable training-area definitions, connecting scenery development with structured content records and scenario configuration.

Training Object Placement Editor

Scenario composition

The placement workspace combines friendly/enemy object groups, an asset library and a selected vessel preview. Placement, selection, movement, rotation, deletion and saving controls organise scene assembly within a consistent interface design.

RMN content independence

Asset definition and scenario placement are presented as separate editing tasks. Our RMN delivery plan provides the agreed source content, developer tools and documentation to support independent scenario modification.

Training Object Placement Editor: scenario composition, object positioning and content library management.

Environmental conditions

Weather and lighting

Sunny, rainy and foggy conditions sit alongside morning, dusk and night settings. These treatments show how a consistent training area can be presented across weather, visibility and lighting conditions.

Training application

Visibility and lighting variations support situational-awareness training. Our environment design connects presentation settings with the exercise context, enabling instructors to choose conditions suited to the training objective.

Environmental presentation: sunny, rainy, foggy, morning, dusk and night settings.

Multiple training views

Complementary displays

Our interface design presents a radar-style plan view beside a 3D observation window. Matching contact identities connect both displays, helping operators interpret relative position and the visual exercise scene together.

Coordinated display design

The display approach brings contact information, geographic context and observation views together. Configurable layouts support operator and instructor workspaces, with headings, speeds and positions arranged for clear exercise monitoring.

Coordinated radar-style and 3D observation views for exercise monitoring.

EDITOR WORKSPACE

Exercise review workflow

The review workspace brings together date-organised recordings, selected playback, a timeline, playback controls and a command/event log. Exercise entries and timeline markers provide a structured way for instructors to revisit the training sequence.

Debrief and assessment

Playback and timestamped events support discussion of decisions and actions. The review design organises exercise history, commands and key moments for instructor-led debriefing and assessment workflows.

Training review: recording selection, timeline playback and timestamped command/event logs.

Platform summaries

The scenario information design separates friendly platforms from training contacts. Vessel thumbnails, name, code name, coordinates, heading, speed and configuration fields organise platform information for the instructor.

Connected authoring workflow

Environment, placement and scenario information share a consistent editing structure. Platform summaries connect names, coordinates and configuration with the geographic workspace, giving instructors a clear overview of exercise content.

Scenario information: platform summaries, coordinates, configuration and geographic context.

User and role management

The screenshot displays the 'User and Role Management' interface within the 'SIMULATION ENGINE | SIMULATION DEVELOPMENT WORKSPACE'. The interface is divided into several sections:

- Navigation:** Assets, Environment, Scenario, Administration (active), Review.
- USER DIRECTORY:** A table listing users with columns for NAME, ACCOUNT, ROLE, and STATUS. It includes a search bar and a dropdown for 'All roles'.
- ROLE ACCESS SUMMARY:** A table summarizing roles and their descriptions.
- ACCOUNT SETTINGS:** A form for configuring an account, including ID, Name, Account, Password, and Status.
- ROLE SELECTION:** Radio buttons for selecting a role (Coach, Trainee, Commander).
- SELECTED ROLE ACCESS:** Checkboxes for selecting specific access permissions (Scenario preparation, Exercise control, Session review).
- Buttons:** Add, Edit, and Delete buttons at the bottom right.

USER DIRECTORY Table:

NAME	ACCOUNT	ROLE	STATUS
Instructor 01	demo.coach	Coach	Active
Trainee 01	demo.trainee	Trainee	Active
Commander 01	demo.commander	Commander	Active

ROLE ACCESS SUMMARY Table:

ROLE	DESCRIPTION
Coach	Prepare scenarios, control exercises, review sessions
Trainee	Join assigned exercises, view own session records
Commander	Coordinate assigned exercises, review team sessions

ACCOUNT SETTINGS Form:

ID: DEMO-COACH-01
Name: Instructor 01
Account: demo.coach
Password: *****
Status: Active

ROLE SELECTION: Coach (selected), Trainee, Commander

SELECTED ROLE ACCESS: Scenario preparation, Exercise control, Session review

Buttons: Add, Edit, Delete

Account administration

The account administration design brings together a user directory, ID, account and masked-password fields, coach/trainee/commander roles, and Add, Edit and Delete controls.

Role-based training organisation

Role selection and access summaries organise scenario preparation, exercise participation and session review. The workspace presents account settings and role permissions together for clear training administration.

User administration: account configuration, role selection and access management.

VR UNIVERSAL SDN. BHD. | SHIPS · AREAS · OBJECTS · SCENARIOS

Structured simulation content

Our catalogue workspace organises ship, training-area, object and scenario definitions through unique identifiers, asset references and structured properties. Category selection, search and record editing keep content information in one workspace.

Revision and recovery workflow

The working catalogue retains revision history, checks record fields and properties, and exchanges records through JSON export and restore. Our Python/SQLite processing example adds database integrity checks, release manifests and backup/recovery routines.

Tools connected to tasks

The tool inventory connects vessel authoring, GIS scene generation, property editing, scenario configuration and content maintenance. Editable geometry, asset references, parameter records and scenario definitions organise the development workflow around RMN content tasks.

Developer enablement

Technical documentation and practical worksheets guide model export, area configuration, record maintenance and content recovery. Our in-house workspace designs sit alongside Blender, Python, Unity, Cesium, JavaScript and SQLite technology foundations.

Simulation Engine v2 development scope: tool functions, editable formats and RMN workflows. SOC alignment: 2.7.1.6.3.2 and 3.4.4.

Local development and RMN independence

VR UNIVERSAL / DEVELOPMENT CAPABILITY

From editable content to maintainable simulations

In-house authoring and integration methods supporting the proposed Malaysian RMN delivery

Malaysian delivery approach: design, programming, integration, testing and technical support.

Development tools, technical documentation and training support independent content maintenance.

Development tools and Malaysian delivery

Our development methods use Blender and Python for 3D processing, GLB for asset exchange, and JavaScript, JSON and SQLite for content tools and structured data. Our GIS product uses Unity and Cesium. The Malaysian delivery approach brings design, programming, testing, integration and technical support together.

Editable content and capability transfer

Our RMN delivery approach includes editable ship and scenery content, development tools, licence inventories, English documentation, backup/recovery and training for six RMN developers. Content ownership, technical handover and capability transfer support independent scenario maintenance and future content development.

Simulation development. Local capability.

Editable content, connected training systems and development tools for RMN.

3D & GIS CONTENT

Vessel modelling, scan processing, geographic scene generation and asset optimisation.

SIMULATION & TRAINING

Immersive interaction, instructor workspaces, scenario authoring and exercise review.

LOCAL DEVELOPMENT

Software integration, technical documentation, developer training and lifecycle support.
